*QFT- TB GOLD PLUS

| NAME | VALUE | REFERENCE RANGE |
|---|----------|-----------------|
| F Quantiferon-TB GOLD PLUS | NEGATIVE | NEGATIVE |
| F NIL VALUE | 0.02 | (IU/mL) |
| F TB1 antigen-Nil Value | 0.00 | (IU/ml) |
| F TB2 antigen-Nil Value | 0.00 | (IU/ml) |
| F MITOGEN- Nil Value | 8.32 | (IU/ml) |
| <div>- Diagnosing or excluding tuberculosis disease, and assessing the probability of LTBI, requires a combination of epidemiological, historical, medical, and diagnostic findings that should be taken into account when interpreting QuantiFERON-TB Gold Plus results. See general guidance on the diagnosis and treatment of TB disease and LTBI (https://www.cdc.gov/tb/publications/guidelines/default.htm).</div> <div>- In clinical studies, less than 0.25% of subjects had interferon gamma levels of >8.0 IU/mL for the Nil control.</div> <div>- The magnitude of the measured interferon gamma level cannot be correlated to stage or degree of infection, level of immune responsiveness or, likelihood for progression to active disease. A positive TB response in persons who are negative to mitogen is rare, but has been seen in patients with TB disease. This indicates the interferon gamma response to TB antigen is greater than that to mitogen, which is possible as the level of mitogen does not maximally stimulate interferon gamma production by lymphocytes.</div> | | |
